Cal. A127A

Characteristics

Casing diameter:

ø 30.1 mm

Maximum height:

6.5 mm without battery

Frequency of quartz crystal oscillator: 32,768 Hz (Hz = Hertz Cycle per second) Time display: Digital Display System showing hour, minute, second and day of the week Calendar display: Digital Display System showing month, date and day of the week

Stopwatch display: I 2-hour Digital Display System showing hours, minutes and seconds (or minutes, seconds and

1/100 seconds up to 20 minutes measurement)

Counter display: Two counter displays enable to indicate from 1 to 9999 (1 counter) and from 1 to 99 (2 counters).

Display medium: Nematic Liquid Crystal, FE-Mode. Time micro adjustor: Trimmer condenser system

Illuminating light: Illuminates all the digital displays in the dark by depressing the light button.

Battery life indicator: All the digits in the display begin flashing.

Module

I. SPECIFICATIONS

Item	Cal. No. A127A			
Display medium	Nematic Liquid Crystal, FEM (Field Effect Mode)			
Display system	Four-function changeover system with time, stopwatch, counter and time/calendar setting functions. Time function: Digital display system showing hour, minute, second and day of the week. In the time function, calendar and elapsing time in the stopwatch function are displayed by depressing a button. Calendar: Digital display system showing month, date and day of the week. Stopwatch function: 12-hour digital display system showing hour, minute,			
	second and 1/100 second (The 1/100 second measurement is possible up to 20 minutes.)			
	Counter function:			
	Single counter Counting up to 9999			
	Twin counter Counting up to 99 in two ways Time/calendar setting function: Time and calendar can be set to operate at a desired second, minute, hour (with "A" (for A.M.)/"P" (for P.M.) indication), date, month and day of the week.			
Additional mechanism	 Battery life indicator (All the digits in the display start flashing when the battery life nears its end.) Illuminating light Pattern segment checking system 			
Crystal oscillator	32,768 Hz (Hz = Hertz Cycle per second)			
Loss/gain	Loss/gain at normal temperature range			
	Monthly rate: less than 15 seconds			
	(Annual rate: less than 3 minutes)			
Casing diameter	φ30.1 mm			
Height	6.5 mm without battery			
Operational temperature range	$-10^{\circ}\text{C} \sim +60^{\circ}\text{C} (14^{\circ}\text{F} \sim 140^{\circ}\text{F})$			
Regulation system	Trimmer condenser			
Battery power	Silver oxide battery: U.C.C. 389, Maxell SR1130W or Toshiba WG-10 Battery life is approximately 3 years. Voltage: 1.55 V			
IC (Integrated Circuit)	C-MOS-LSi 1 unit

II. DISASSEMBLING, REASSEMBLING AND LUBRICATING

Remarks for disassembling

5 Module

 As the liquid crystal panel frame is fixed fast to the casebezel, pry it up with tweezers and remove the module.

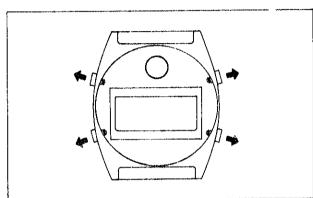

Remarks for reassembling

6 Casebezel

 Before reassembling the module, pull out all buttons so that the switch springs do not prevent the module from being reassembled.

(Push the buttons from inside with the tips of tweezers.)

5 Module

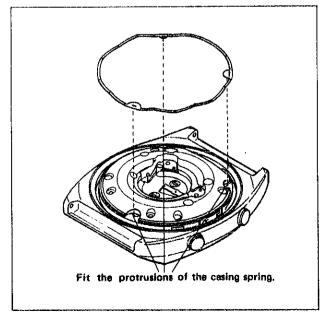

- As the liquid crystal panel frame is fixed fast to the casebezel, push in the module with fingers.
- Push it in so that it does not catch the buttons.

4 Casing spring

 Set the casing spring as shown in the illustration on the right with the upper side and the lower side placed correctly.

(There are three protrusions on the casing spring; two of which are larger and one is smaller. Be sure to fit each of them correctly to the corresponding notches of the module.)

How to replace the glass

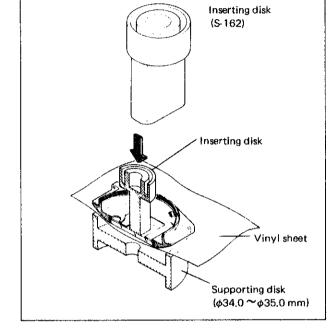

(Do not disassemble the glass except when the replacement of the glass and the panel cover is necessary.)

- How to disassemble the glass
- Remove the glass with the SEIKO tightening tool S-220.

Inserting disk: S-162

Supporting disk: ϕ 34.0 \sim ϕ 35.0 mm

- Place a vinyl sheet between the glass and the supporting disk as shown in the illustration on the right.
- Push only the glass for disassembling with the inserting disk (S-162). Do not push the panel cover.

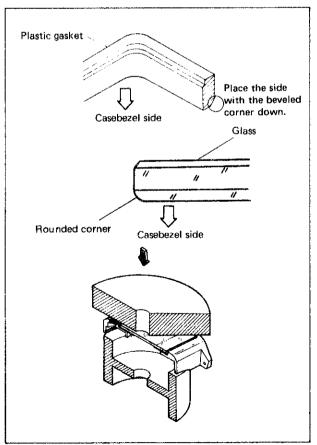

How to reassemble the glass

- (i) Set the plastic gasket.
- Be sure to replace the plastic gasket with a new one.
- Be careful not to mistake the upper side for the lower side.
- (ii) Reassemble the panel cover.
- Be sure to set the backside of the panel cover fast to the casebezel.
- Be sure that the space between the casebezel and the edge of the panel cover is uniform in width.
- (iii) Place the glass.
- Be careful not to mistake the upper side for the lower side. Place the round side down.
- (iv) Push in the glass (by using S-220).
 Inserting disk: Plastic supporting disk (S-173)
 Supporting disk: \$\phi 28.0 \text{ or } \phi 28.5 \text{ mm}

Some models are reassembled in the order of 1 panel cover, 2 plastic gasket. See the SEIKO Watch Casing Guide for details.

Ex.) Case No. A127-5019 A3

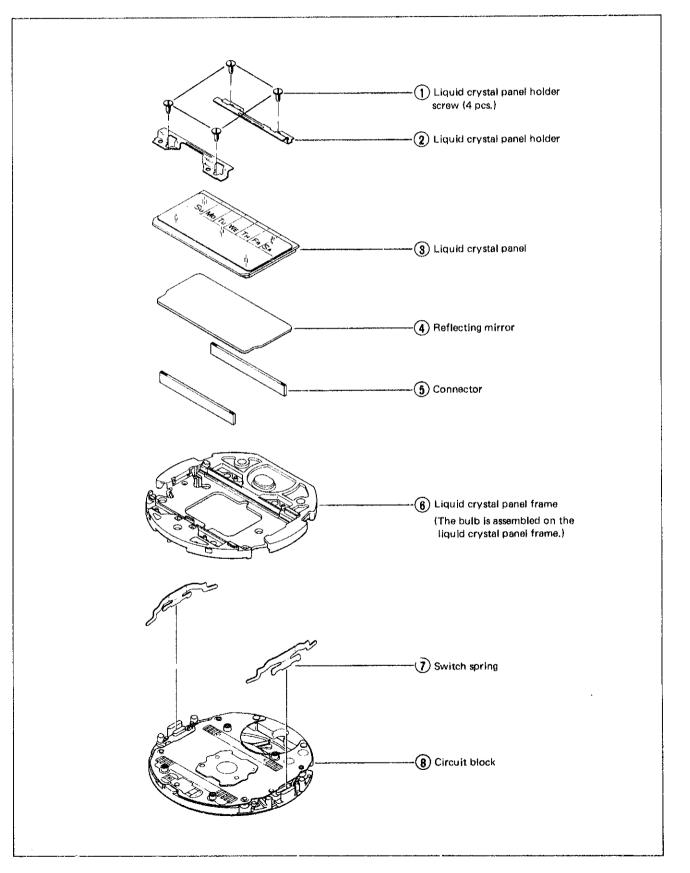

2. Disassembling and reassembling of the module

Disassembling procedures Figs.:

1 ~ 8

Reassembling procedures Figs.:

8 ~ 1

Remarks for disassembling

4 Reflecting mirror

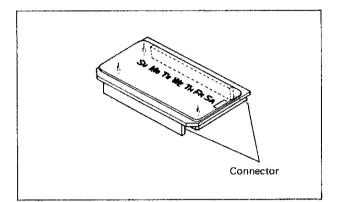

• Be careful not to scratch or contaminate the reflecting mirror.

5 Connector

- The connectors may be disassembled together with the liquid crystal panel.
- Be careful not to scratch the connectors with tweezers
- There is no difference between the connectors in the top and bottom.

8 Circuit block

 Be careful not to touch the electronic parts except when it is necessary.

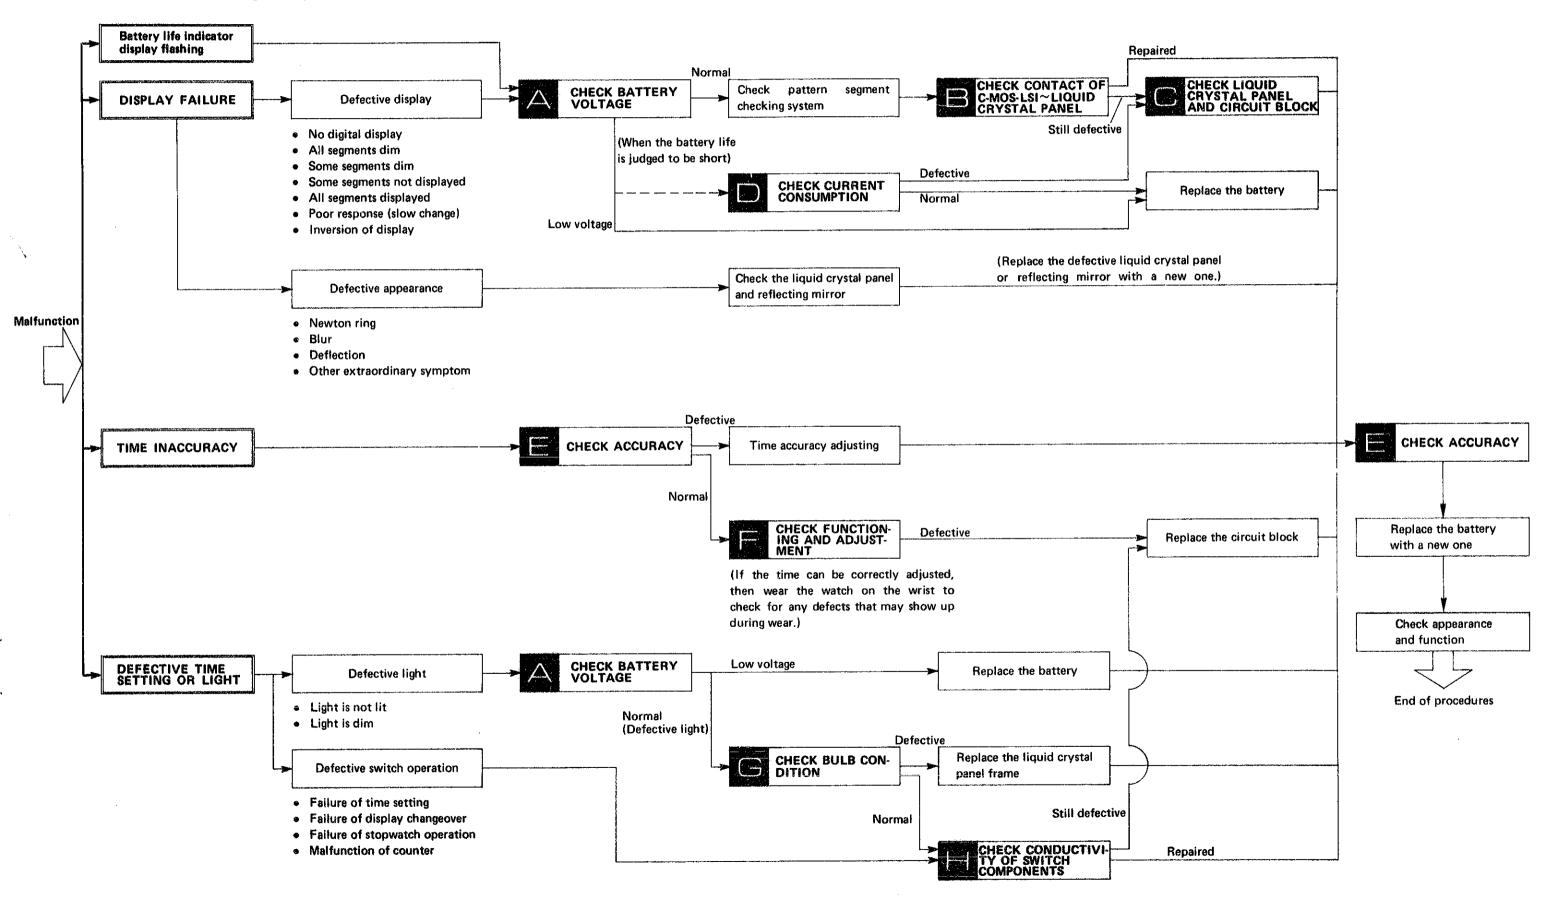

Remarks for reassembling

7 Switch spring

- Set the switch spring in position vertically from above.
- Push it in by the flat part of the end of the tweezers.

1. Guide table for checking and adjustment

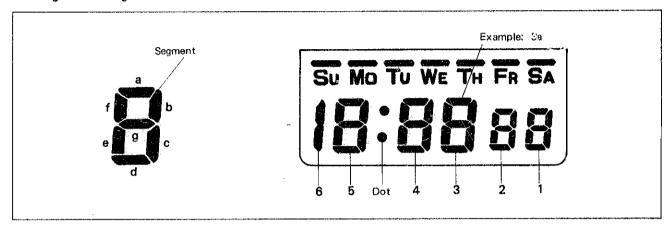

1. CHECKING AND ADJUSTMENT 1. Quide table for checking and adjustments | District | States | States

2. Relationship between the segment (Liquid Crystal Panel Electrode) and the C-MOS-LSI output terminal

A complete knowledge of how the segment (Liquid Crystal Panel Electrode) works with the C-MOS-LSI output terminal will provide the proper procedures for checking and adjustment.

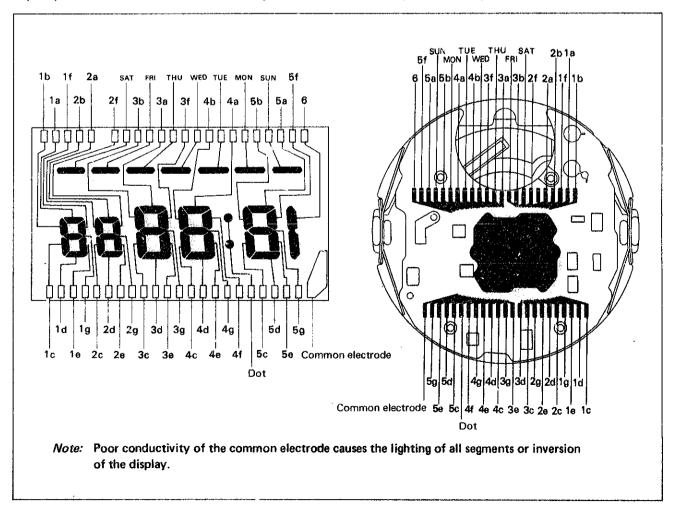

• Designation of segment

• Relationship between the segment and the C-MOS-LSI output terminal

The liquid crystal panel electrode is connected electrically with each segment which forms a digital figure as shown in the illustration of the panel pattern below.

(The panel pattern can be seen ** the panel is slightly tilted and looked at in an angular position.) Also, the liquid crystal panel electrode is connected electrically with the C-MOS-LSI output terminal by the connector.

REPAIR

AND

LEAKAGE

ELECTROLYTE

BATTERY

CHECK

5

When there is battery electrolyte leakage, refer to "HOW TO CHECK BATTERY ELECTROLYTE LEAKAGE AND REPAIR" below for repairing.

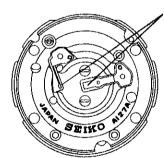

More than 1.5V ... Normal Less than 1.5V ... Defective

Result and repair

- (1) Remove the module from the case.
- (2) Disassemble the module.
- (3) Wipe off battery electrolyte on the circuit block.
 - 1. Wipe off battery electrolyte with a cloth moistened with distilled water. If distilled water is not available, use tap water.

Note

- Do not expose the trimmer condenser to water or alcohol, and if it is exposed, there may be a change in the condenser capacity and eventually in the time accuracy.
- Do not use a cloth which gives off lint, such as gauze, flannel, etc.
- When the circuit block is cleaned, be sure to clean the connecting portions.

Connecting portion

If the circuit block is badly contaminated with battery electrolyte, replace the circuit block with a new one.

Ex.

- When the circuit block is rusted.
- When even the liquid crystal panel side is contaminated with battery electrolyte.

- 2. Rinse with alcohol.
- (If the cleaned portions remain wet with water, they will corrode with rust.)
- 3. Dry with warm air by using a dryer.
- (4) Clean the other parts (switch spring, etc.).
 - 1. Wipe off battery electrolyte on each part with a soft brush moistened with distilled water. If distilled water is not available, use tap water.
 - 2. Rinse with alcohol.
 - 3. Dry with warm air by using a dryer.
- (5) Reassemble the module.
 - Replace the battery with a new one.
- (6) Check to see if the time and calendar function, the stopwatch function, the calendar function and the current consumption are normal.

Result and repair **Procedures** If some segments are dead or dim, set the mode for the time and calendar setting function. Then depress buttons (B) and © together to find defective seg-11.00 (0.10 (0.10 (0.10) (0.10) (0.10) (0.10) Proceed to **高元光版製料**配 ments. 18:88 ee (If there is no defective segment, all segments light up.) After removing the liquid crystal panel, check for poor conductivity of the liquid crystal panel, connector and C-MOS-LSI output terminal whose segments are found to be defective in "CHECK PATTERN SEGMENT CHECKING SYSTEM." (Refer to the "Relationship between the segment and the C-MOS-LSI output terminal" on page 8.) Use a microscope for checking. (1) Check for dust, lint and other contamination on the liquid crystal panel electrode. **Uncontaminated: Normal** C-MOS-LSI~LIQUID CRYSTAL PANEL Proceed to (3). Contaminated: Defective Liquid crystal panel electrode Wipe off any foreign matter. (2) Check for any contamination, scratch, crack and break of the connector. No contamination, scratch, crack or break: Normal Proceed to (3). Be sure to check the connect-Contaminated: Defective ing portions of the liquid crystal panel and the circuit block Clean off. Scratched, cracked or broken: P Defective Replace the connector CONTACT with a new one. (3) Check for dust, lint and other contamination on the output terminal of the circuit block. CHECK **Uncontaminated: Normal** Proceed to Contaminated: Defective Wipe off any foreign matter. Output terminal of the circuit block

BLOCK CIRCUIT AND (PANEL Electrode of defective seament CRYSTAL (2) Check the circuit 1. Set up the Volt-ohm-LIQUID

Procedures Check to see if the liquid crystal panel and the circuit block function correctly. (Refer to the "Relationship between the segment and the C-MOS-LSI output terminal" on page 8.) (1) Check liquid crystal panel. 1. Set up the volt-ohm-meter. Range to be used: OHMS R x 1 ~ R x 1K Note: Any range will do if more than 3V is applied to the terminal of the volt-ohm-meter. When the volt-ohmmeter other than the SEIKO volt-ohm-meter S-831 is used, all segments may not be lit. If any segment does not light, change the range to the one (R x 10K) which is higher in resistance than R x 1K. 2. Remove the liquid crystal panel from the module and turn it upside down. 3. Measuring (Check to see if the corresponding segment lights up.) Note: Either red or black probe will do.

More than 0.8V: Normal (All the terminals must be more than this range of volt-

Return to Less than 0.8V: Defective Replace the circuit block with a new one and check to see if it functions correctly.

Procedures Result and repair Check to see if the current consumption is normal. (Can be checked no matter which function the watch may be performing.) Set up the volt-ohm-meter. Range to be used: DC 12µA (DC 0.03 mA)* *Note: Use the electricity supplier (S-833) and connect as shown in the If the pointer of the volt-ohmmeter swings over the maximum illustration below. value when DC 12µA (DC 0.03mA) 's used, change the range to a greater one where the pointer does not run over the maximum value while applying the probes to the Red probe respective portions. Then, after two or three seconds, return the range to DC 12uA (DC 0.03 mA) again for measuring. Less than 3.0µA: Normal Replace the battery with a new one. More than 3.0µA: Defective CONSUMPTION CURRENT Micro Test MT-10 II*. *Note: 1 Power switch . . . ON If the pointer of the Micro Test 2 Polarity changeover button: + MT-10 II swings over the maximum value while the current consump-3 Current consumption/ CHECK tion is measured, depress the Cur-Voltage indication button: μA rent consumption/Voltage indication button (3) so that it is released 4 Voltage selection button: 1.55V to indicate the voltage (A.V) while Probe Black (+): Battery connection the black probe and the red clip are Clip Red (-): Button applied. Then, after two or three (except the light button) seconds, depress the Current consumption/Voltage indication button again so that it holds in the pushed in position (µA ___) to indicate the current consumption for measuring. Apply the red clip (+) to the button B or button C for measuring. Be careful not to depress the buttons while measuring.

	Procedures	Result and repair
CHECK ACCURACY	Check gain and loss of time. 1. Set up the Quartz Tester. 2. Measuring	Does not lose or gain: Normal Proceed to the following procedure. Loses or gains: Defective Proceed to Time accuracy adjusting. Time accuracy is adjusted by turning the trimmer condenser.
CHECK FUNCTIONING AND ADJUSTMENT	Check to see if the watch functions correctly and can be adjusted by the button operation. 1. Check the stopwatch function. • Check to see if "start", "stop", "lap", "lap release" and "reset" function correctly. 2. Check the counter function. • Check to see if seconds can be counted correctly or can be reset to "00" second. 3. Check the time and calendar setting function. • Set the time and calendar digits more than one cycle for each unit and check to see if each digit is advancing correctly.	Functions correctly and can be adjusted: Normal Wear the watch on the wrist to check time accuracy. Does not function correctly or cannot be adjusted: Defective Proceed to Replace the circuit block.

	Procedures	Result and repair
G	(1) Check to see if the bulb lead terminals touch the lead terminal of the circuit block.1. Check to see if the two bulb lead terminals protrude by more	
	than 0.3mm from the backside of the liquid crystal panel frame. And check for any dust, lint and other contamination of the bulb lead terminal.	
	Protrusion "h" of the bulb lead terminal should be two-thirds or more of the thickness "a" of the liquid crystal panel frame.	Protrude by more than 0.3mm: Normal Protrude by less than 0.3mm: Defective Pull out by using tweezers
NO	Check for any contamination on the bulb lead terminal of the circuit block.	
CHECK BULB CONDITION	Bulb lead terminal	No dust, lint or uncontaminated: Normal Proceed to (2). Dust, lint or contaminated: Defective Wipe off any foreign matter.
5	(2) Check to see if there is a broken filament in the bulb and if there is any break in the welded portion of the bulb lead ter- minal.	
	 Set up the volt-ohm-meter. Range to be used: OHMS R x 1 Measuring Apply the two probes of the volt-ohm-meter to the bulb lead terminals as shown in the illustration. 	Bulb lights up: Normal Proceed to . Bulb does not light up: Defective Proceed to Replace the liquid crystal panel frame.
	Note: Either red or black probe will do.	

Check to see if the swit

COMPONENTS

SWITCH

P L

CONDUCTIVITY

CHECK

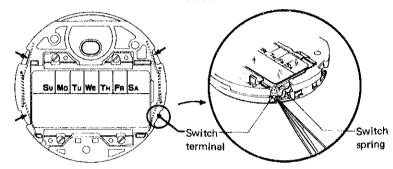

. .

Check to see if the switch spring functions correctly.

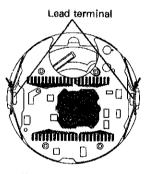

(1) Check to see if the switch springs (four arrow-marked portions shown in the illustration below) function correctly when they are pushed in.

Procedures

 Check to see if the four arrow-marked springs touch the switch terminals of the circuit block when they are pushed in with the tips of tweezers and that they do not touch the switch terminals of the circuit block when released.

- 2. Check for dust, lint and other contamination on the contacting portions.
- (2) Check to see if the lead terminal of the switch spring touches the lead terminal of the circuit block.
- 1. Check to see if the two arrow-marked portions touch correctly when the liquid crystal panel frame is disassembled.

- 2. Check for dust, lint and other contamination on the connecting portions.
- (3) Check to see if the pins for the switch terminals are fixed firmly in the circuit board. Check to see if the four arrowmarked pins for the switch terminals are fixed firmly in the circuit board by slightly lifting the circuit board with tweezers as shown in the illustration on the right.

Functions correctly: Normai Does not function correctly: Defective

Result and repair

If the switch springs do not function correctly after they are adjusted, replace them with new ones.

No dust, lint or uncontaminated: Normal

Proceed to [1] (2).

Dust, lint or contaminated:

Defective

Wipe off any foreign matter.

Touch: Normal
Do not touch: Defective
Adjust by using tweezers
so that the lead terminal
of the circuit block touches
the switch spring.

No dust, lint or uncontaminated: Normal

Proceed to (3).

Dust, lint or contaminated:

Defective

Wipe off any foreign matter.

Fixed firmly: Normal Proceed to Replace the circuit block. (Defective C-MOS-LSI)

Not fixed firmly: Defective Replace the circuit block. (The pins for the switch terminals are not fixed firmly.)
