Cal. F023A

Characteristics

Casing diameter:

∮ 25.6 mm

Maximum height:

3.3 mm

Frequency of quartz crystal oscillator: 32,768 Hz (Hz=Hertz..... Cycles per second)

Time functions: I 2-hour Digital Display System showing hour, minute and second.

The dots blink once every second.

Calendar functions: Digital Display System showing month, day and date. Display medium : Single Crystal Display (Nematic Liquid Crystal, FE-Mode)

Time micro-adjustor: Trimmer condenser system

Battery life indicator: The entire display begins flashing.

Calibre F023A

Module

I. SPECIFICATIONS AND FEATURES

item	Calibre No. F023A
Display medium	Nematic Liquid Crystal, FEM (Field Effect Mode)
Display system	 Time display (Constant display) Hour & Minute: 12-hour digital display system Calendar display (when the time digits are displayed, depress button "A" and the Month/Date digits and then the Day digits are automatically displayed each for 2 seconds.) Month & Date: Automatic calendar System (except February of lead years) Day: Displayed in English Second display (After the day digits are displayed, the second digits are automatically displayed for 2 seconds. If button "A" is depressed when the second digits are being displayed, the display continues for about 4 to 5 minutes.)
Additional mechanism	Battery life indicator
Crystal oscillator	32,768 Hz (Hz = Hertz Cycles per second)
Loss/gain	Loss/gain at normal temperature range Mean monthly rate: less than 10 seconds Annual rate: less than 2 minutes
Casing diameter	φ 25.6 mm (21.5 mm between 12 o'clock and 6 o'clock sides)
Height	3.3 mm without battery
Operational temperature range	-10°C ~ +60°C (14°F ~ 140°F)
Regulation system	Triranter condenser
Battery power	SEIKO SB-DS silver peroxide battery Battery life is approximately 3 years. Voltage 1.5 V
IC (Integrated Circuit)	C-MOS-LSI 1 unit

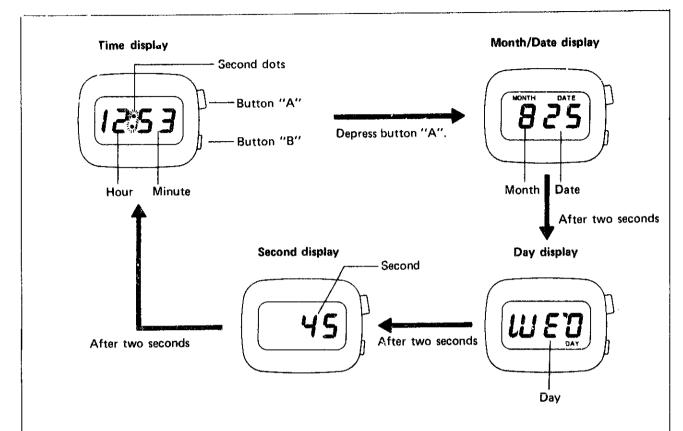

2. Features

SEIKO THIN LC DIGITAL QUARTZ Cal. F023A is a compact and dress type men's quartz oscillator watch which conforms to the high accuracy and reliability for which the existing series of SEIKO LC DIGITAL QUARTZ are known.

- (1) In addition to the "hour" and "minute" digits, the "month/date," "day" and "second" digits are displayed automatically in turn by a single depression of a button.
- It has an automatic calendar system, and therefore even and odd months except February of leap years are automatically adjusted.
- (3) Equipped with a battery life indicator, Cal. F023A signals the expiration of battery life in advance.
- (4) With the simplified block system of the module, it is easier to provide after-sale service.
- (5) As the day indicator almost fills the entire display panel when displayed, it can be read at a glance.

II. DISPLAY AND BUTTON OPERATION

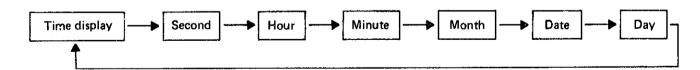

1. Display

- Depress button "A" when the hour and minute digits are displayed. The Month/Date, Day and Second digits are automatically displayed in turn each for 2 seconds and the hour and minute digits are displayed again.
- Depress button "A" when the second digits are displayed. The second display continues about 4 to 5 minutes and then the hour and minute digits are again automatically displayed. (When button "A" is depressed again, the hour and minute digits will be displayed readily.)

2. How to adjust the display

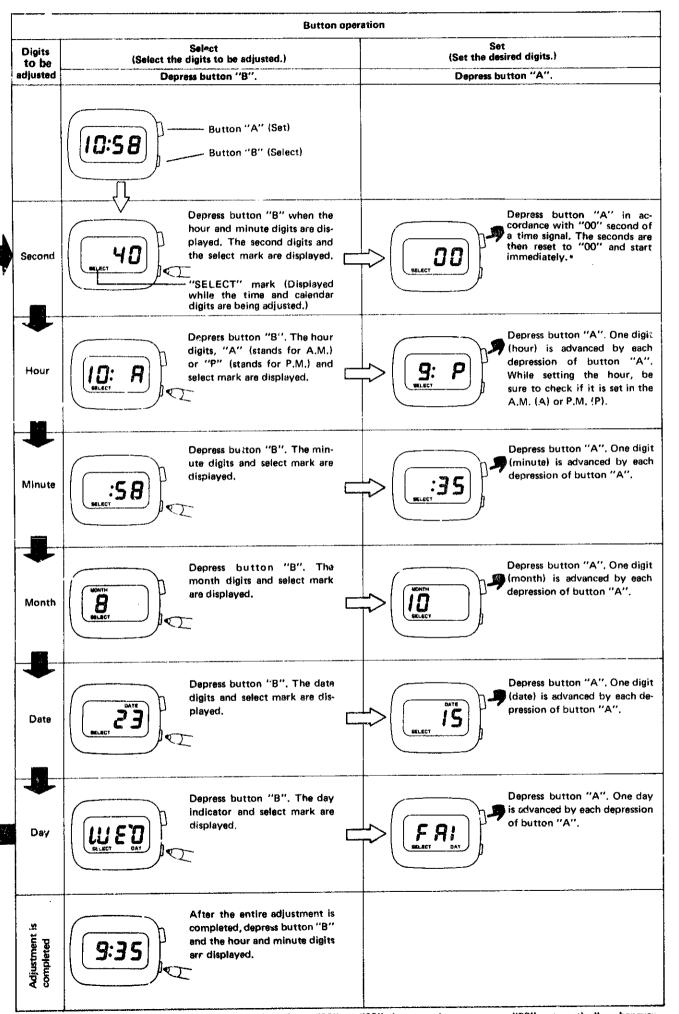

(1) Each depression of button "B" will select the digits to be adjusted in the following order.

- (2) "SELECT" mark is displayed while digits are being adjusted.
- (3) One digit is advanced by each depression of button "A".

[Example]

How to change the indication of Wednesday, 10:58:40 A.M., September 23 into Friday, 9:35:00 P.M., October 15.

When the seconds count any numbers from "00" to "29" the seconds are reset to "00" automatically whenever button "A" is depressed. When the seconds count any numbers from "30" to "59" and button "A" is depressed, one minute is added and the seconds immediately return to "00".

III. BATTERY LIFE INDICATOR

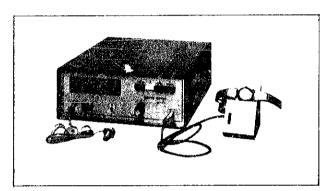

• The battery life indicator starts the entire display flashing every second when the battery life is coming to its end. However, the vatch will remain accurate while the entire display is flashing.

Note for handling the battery
 Be sure to place the battery with its (—) surface up whenever it is disassembled.

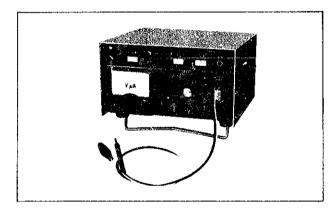

IV. AFTER-SALE SERVICING INSTRUMENTS AND MATERIALS

For after-sale servicing of SEIKO Thin LC Digital Quartz Cal. F023A, the following instruments and materials are necessary.

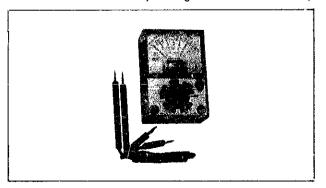

Quartz Tester
 Used to check time accuracy (daily rate).

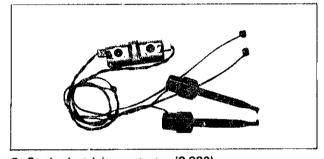

2. Micro Test
Used to check current consumption and to supply constant voltage power.

3. Volt-ohm-meter (5-831)
Used to check battery voltage and its conductivity.

 Current supplier (S-833)
 Used to supply constant voltage power to check the electronic circuit block.

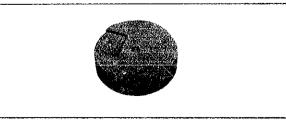

5. Static electricity protector (S-830)
Used to protect the electronic circuit block of Digital
Quartz from being damaged by static electricity.

6. Inserting disk (S-162)
Used to disassemble the glass.

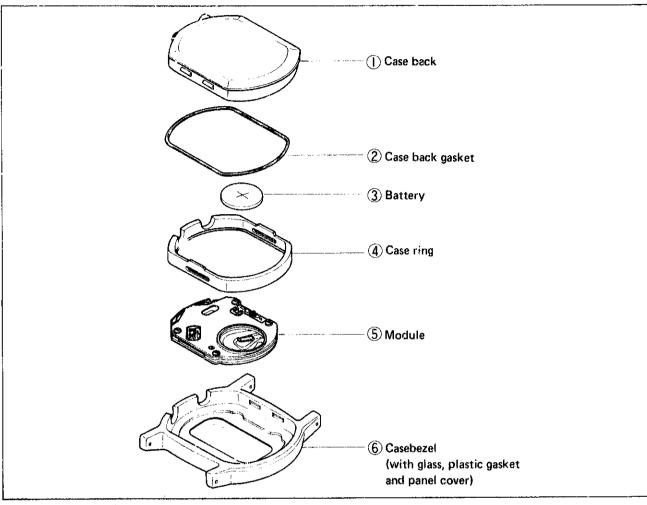

7. Plastic supporting disk (S-173)
Used to reassemble the glass.

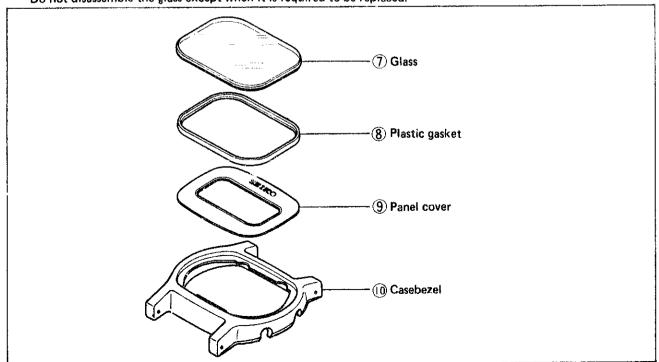

(The module holder is not necessary for this calibre. Disassemble and reassemble the module on the static electricity protector.)

1. How to disassemble the module

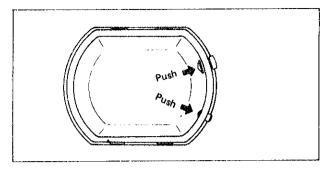

2. How to disassemble the glass

Do not disassemble the glass except when it is required to be replaced.

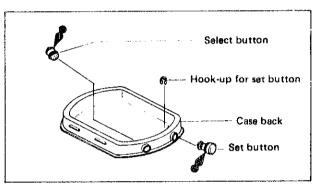

Remarks for disassembling and reassembling HOW TO REASSEMBLE THE CASE BACK

Reassemble the case back with the set and select buttons in a "PULLED OUT" position. The switch portions might be damaged if the case back is reassembled without the set and select buttons in a "PULLED OUT" position.

HOW TO DISASSEMBLE THE BUTTONS

- Lubricating : Silicon grease 500,000 C.S., normal quantity
- Set button (button "A") Disassemble the hook-up for set button and then pull the set button outward for disassembling.
- Select button (button "B") Push the select button inward for disassembling.

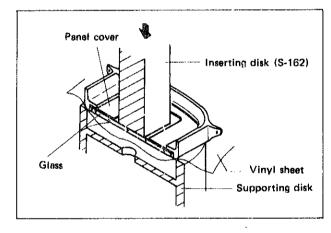

HOW TO REPLACE THE GLASS

• How to disassemble the glass (Use the tightening tool

Use the inserting disk (S-162) to push the glass from inside for disassembling,

Be careful not to depress the panel cover.

Supporting disk: Select the supporting disk whose diameter is larger than that of the glass.

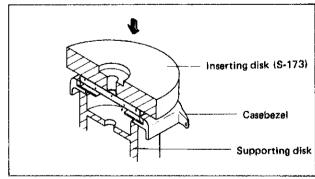

How to reassemble the glass Use the inserting disk (S-173).

Supporting disk: Select the supporting disk contained

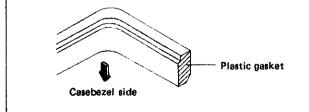

in S-160 Disk unit, whose diameter is smaller than the inside diameter

of the casebezel.

Be sure to replace the plastic gasket with a new one when the glass is disassembled.

Be careful not to mistake the upper side for the lower side.

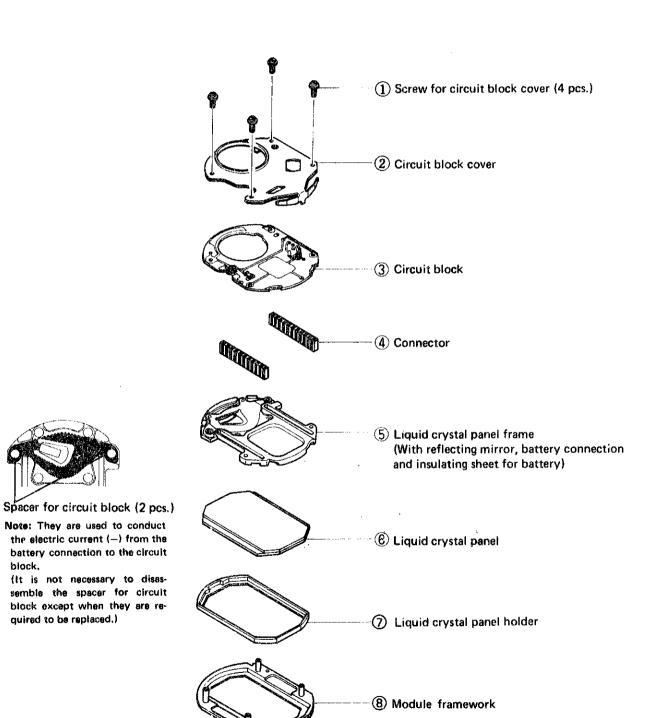

Plastic gasket

VI. DISASSEMBLING, REASSEMBLING AND CLEANING

Disassembling procedures Figs.: (1)~(8) Reassembling procedures Figs. : $(8) \sim (1)$

1. Disassembling and reassembling

Remarks for disassembling and reassembling

1 Screw for circuit block cover

Tighten the two screws on the battery side first.

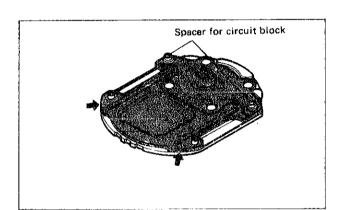

Connector

Although two connectors are used, there is no difference between the two.

The black portions are conductive. Check to see if there are no scratches, or contamination.

Liquid crystal panel frame

- How to disassemble from module framework. Push the tip of a screwdriver into the arrow-marked portions and pry up gradually for disassembling. Be careful not to scratch the reflecting mirror.
- Check to see if the spacer for circuit block is fixed to the liquid crystal panel frame.
- As the liquid crystal panel frame is combined with the reflecting mirror, battery connection and insulator for battery connection, disassemble them as one combined unit,

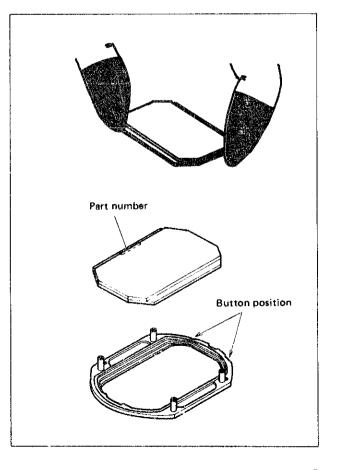

(6) Liquid crystal panel

Use fingercots to disassemble and reassemble the liquid crystal panel. Be careful not to push the surface of the liquid crystal panel too hard.

How to reassemble

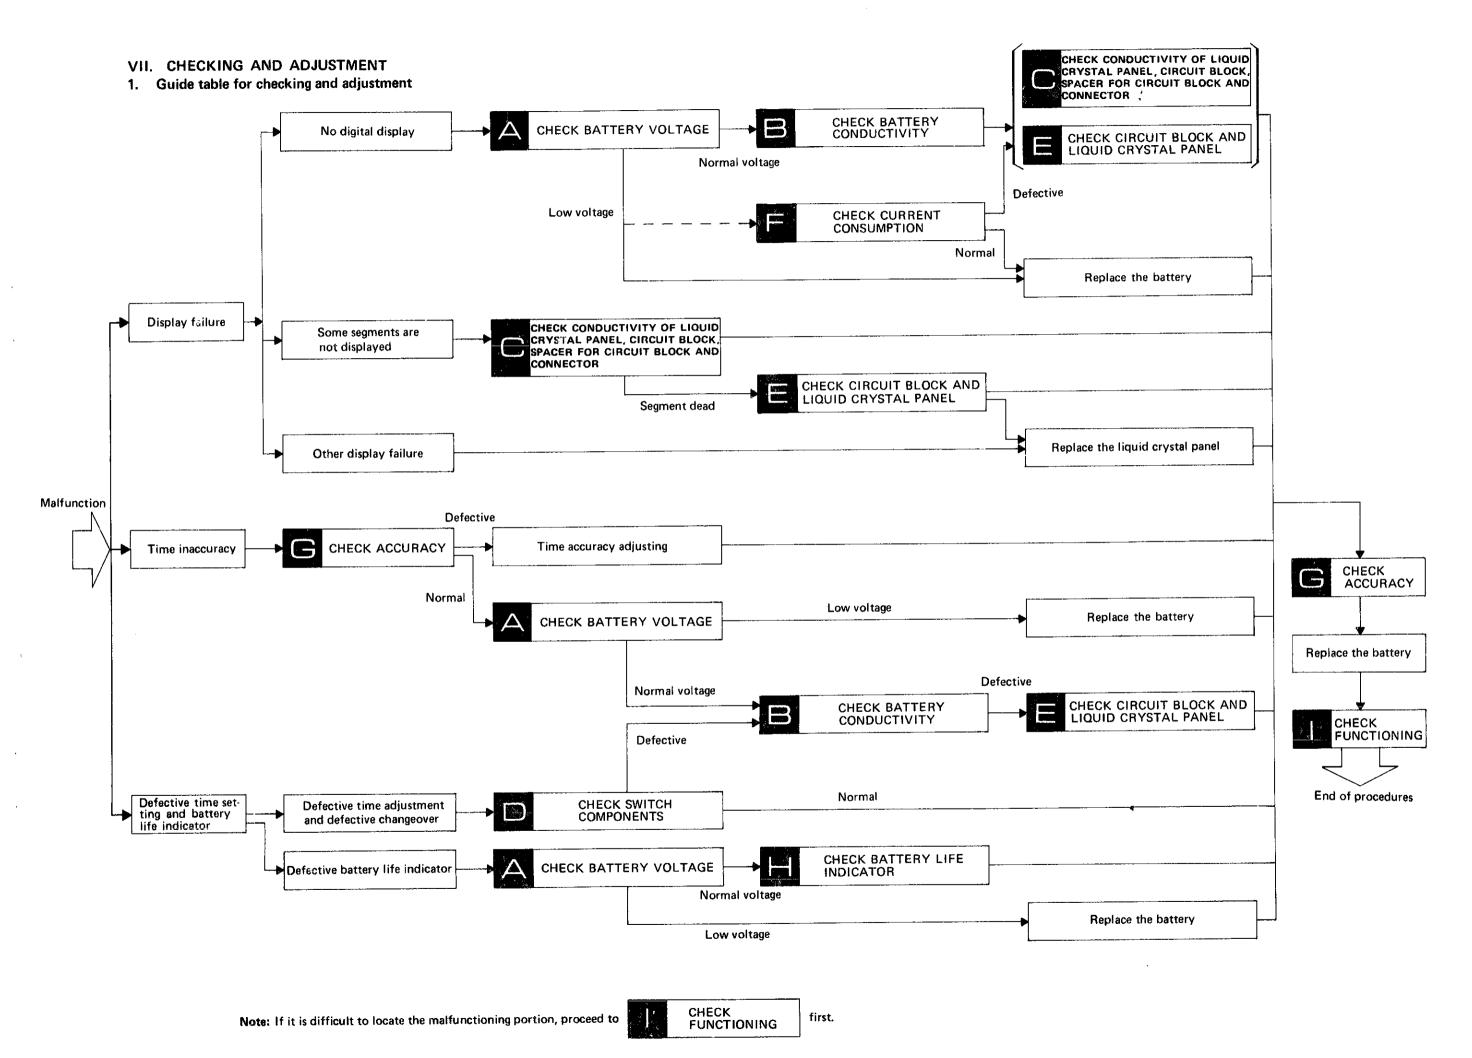

Reassemble the liquid crystal panel in such a way that its part number portion comes to the upper side when the arrow-marked portions (button position) of the module framework are on the right side.

block.

quired to be replaced.)

				Approximate the second
Cleaning HOW TO CLEAN				
Name of parts	Cleaning	Drying	Solution	Remarks
Connector	Rise or wash with a soft brush.	Cool air	Alcohol	 Do not use benzine or tri- chloroethylene as they ex- pand the connector. Be sure to reassemble after drying thoroughly.
Plastic parts (liquid crystal panel holder)	Rinse or wash with a soft brush.	Cool air	Benzine or alcohol	
Other parts Circuit block cover Module framework	Rinse or wash with a soft brush.	Cool or hot air	Benzine, tri- chloroethylene or alcohol	 Be careful not to bend the switch spring por- tion of the circuit block cover when cleaning.
Circuit block	Liquid crystal pa	anel frame	Liquid crystal p	panel Battery
Only the conductive port cool air. (Wipe any stains Use a brush to clean dust	on the battery with	d with a cloth a dry cloth.)	n moistened with b	penzine or alcohol and dried wit

2. Malfunction and checking points

- Check in numerical order.
- Refer to "Procedures for checking and adjustment" on the following pages.

		CHECKING POINTS								
		A	В	С			D		F	
	FAULTY SYMPTOMS	Battery voltage	Battery conductivity	Liquid crystal panel	Circuit block	Spacer for circuit block	Connector	Switch components	Circuit block, liquid crystal panel	Battery life indicator
	Digits are displayed, but second dots do not flash.	1	2						3	
	No digital display, dim digital display or extremely slow response.	1	2	3	5	6	4		7	
AY FAILURE	Some segments of the digital figures are not lighted or dim.			2	. 3		1)			
DISPLAY	All segments are lighted. MONTH BATE SELECT DAY			2	3		1			
	Some portions of the liquid crystal panel will make black dots or iridescent circles.			1						
CURACY	Gain or loss tested by Quartz Tester	1	2					-		
TIME INACCURACY	Though Quartz Tester indicates the normal accuracy, a watch gains or loses when it is worn on the wrist.	1	2						3	
TIME AND SETTING	Failure of time and calendar setting. The display extinguishes while the time and calendar digits are being set. or the changeover of the display cannot be made.							1	2	
DEFECTIVE TIME AND CALENDAR SETTING	All digits are flashing.	1								2

3. Procedures for checking and adjustment

	Procedure	Result
CHECK BATTERY VOLTAGE	Use the following procedures to check battery voltage. Set up the volt-ohm-meter Range to be used: DC 3V Measuring Probe Red (+) Battery surface (+) Probe Black (-) Rattery surface (-)	More than 1.5 V> Normal Less than 1.5 V> Defective Replace the battery with a new one.
	First check Check for any contamination on the battery and the battery connection. Second check Make sure that the screws for circuit block cover are tightened firmly. Battery connection Screw for circuit block cover	Uncontaminated> Normal Contaminated> Defective Wipe off any foreign matter. No loosened screws> Normal Loosened screws> Defective Retighten screws.
CHECK BATTERY CONDUCTIVITY	 Third check Check to see if there is battery electrolyte leakage 1. Remove the module from the case. 2. Disessemble the module. 3. Clean the parts contaminated with battery electrolyte. • Clean the circuit block (1) Wipe off battery electrolyte on the circuit block with a cloth moistened with distilled water (or normal tap water) first and then with a cloth moistened with alcohol. Note: • Do not use a cloth which gives off lint such as gauze, flannel, etc. • Be careful that the trimmer condenser is not exposed to water or alcohol. (2) Dry with cool air by using a dryer. • Clean the other parts (1) Wipe off battery electrolyte on the other parts with a soft brush moistened with distilled water (or normal tap water). (2) Dry with cool air by using a dryer. Reassemble after making sure that the parts are thoroughly dry. 4. Reassemble the module and replace the battery with a new one. 5. Check to see if the time setting functions and the current consumption are normal. 	No battery electro- iyte leakage

12

Result Procedure First check No contamination, crack or tiny break -> Normal Check for any contamination, crack and tiny break of the connector. → Defective Contaminated ---Wipe off any foreign mat-AND CONNECTOR Check carefully the connecting por-Crack or tiny break → Defective Replace the tions of the liquid crystal panel and connector the circuit block. with a new one. CIRCUIT BLOCK, SPACER FOR CIRCUIT BLOCK No contamination Second check Check the liquid crystal panel electrode (connecting portion of or glass defect the connector) for any foreign matter and glass defects. Contaminated ---→ Defective Wipe off any foreign mat-Liquid crystal panel electrode ter. →Defective Glass defect -Replace the liquid crystal panel with a new one. Third check Check for any contamination of the spacer for circuit block. Check carefully the connecting Uncontaminated -→Normal portions of the circuit block and →Defective Contaminated -CHECK CONDUCTIVITY OF LIQUID CRYSTAL PANEL, the pattery connection. Wipe off any foreign mat-Fourth check Check the circuit block electrode (connecting portion of the connector) for any foreign matter. Uncontaminated ---> Normal Contaminated -->Defective Wipe off any foreign matter. Circuit block electrode

	Procedure	Result
	First check Check for any contamination on the switch spring of the circuit block cover and the circuit block (connecting portion of the switch spring). Circuit block cover Switch spring	Uncontaminated ——→ Normal Contaminated ——→ Defective Wipe off any foreign mat ter.
A CONTRACT C	Second check Check for clearance between the circuit block cover and the circuit block. (Check after the circuit block cover is reassembled.)	Clearance ——> Normal No clearance —> Defective Correct the switch spring with tweez ers so that there is a clearance.
	First check Check to see if the electric signal flows into the connector from the circuit block correctly. (1) Supply voltage power (1.5 V) to the circuit block by using the electricity supplier. Set up the electricity supplier (S-833). (2) Set up the Volt-ohm-meter. Range to be used: DC3V (3) Measuring Probe Red (+) Circuit block (+) Probe Black (-) Circuit block electrode (Apply to several portions)	More than 0.8 V—>Normal Less than 0.8 V—>Defective Replace the circuit block with a new one. The above voltage is obtained when measured by either the volt-ohmmeter S-831 (or AF-105) mentioned in the Technical Guide or a volt-ohmmeter whose internal resistance is higher than that of the S-831 (or AF-105).
	Second check Check for any broken panel pattern, short circuit, etc. of the liquid crystal panel. (1) Set up the volt-ohm-meter (Any range will do if more than 3 V is applied to the terminal of the volt-ohm-meter.) Range to be used: OHMS R X 1 (2) Disassemble the liquid crystal panel from the module and turn the liquid crystal panel upside down.	

	Procedure	Result
CHECK CIRCUIT BLOCK AND LIQUID CRYSTAL PANEL	Apply the red and black probes of the volt-ohm-meter to the common electrode and the segment electrode of the liquid crystal panel. (Either red or black probe will do.) DATE MONTH DATE MONTH Segment electrode DAY 10 22 25 30 31 4 DAY 13 22 25 30 35 31 DAY 13 22 25 30 35 35 E 17 20 25 30 36 COLON SELECT Segment electrode Common electrode	Light up> Normal Do not light up> Defective Replace the liquid crystal panel with a new one.
CHECK CURRENT CONSUMPTION	Check to see if the current consumption is normal. (1) Set up the volt-ohm-meter Range to be used: DC 12\(\mu\)A (DC 0.03\(\mu\)A	Less than 2.0 µA→Normal More than 2.0 µA→Defective Proceed to and

Second check

(1) Set up the Micro Test Set the voltage at 1.5 V .

(2) Apply the terminals of the Micro Test to the module in the same way as in First check (2).

Procedure

Display does not

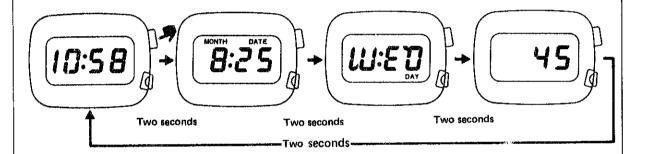

--->Normal Display flashes -> Defective

Result

Replace the circuit block with a new one.

Check to see if display changeover and adjustment function correctly by button operation.

Check to see if the time display, calendar display and second display are changed into the desired display by depressing button "A". (Check to see if the second display is changed into the time display automatically 4 to 5 minutes after button "A" is depressed when the second digits are displayed.)

Second check

FUNCTIONING

Check to see if each digit is selected and set by depressing buttons "A" and "B".

(Make sure that there is no dead segment.)

All procedures of Disassembling, Reassembling, Checking and Adjustment are completed.
